Summary

Data and AI professional with hands-on experience building end-to-end machine learning and software solutions. I specialize in Python, NLP, and developing intelligent applications ranging from traditional data models to modern LLM-powered RAG systems. I enjoy working across the entire stack—whether it's training models, engineering data pipelines, or deploying low-latency backend APIs using FastAPI to solve real-world problems.

Skills

Languages: Python, R, SQL
AI & Machine Learning: Generative AI (LLMs), Deep Learning, NLP, Model Optimization, RAG, Agentic Workflows
Frameworks & Libraries: PyTorch, Scikit-learn, LangChain, LangGraph, FastAPI, Hugging Face, PyMuPDF
MLOps & Infrastructure: Docker, MLflow, Git, GitHub Actions, Linux
Cloud & Databases: AWS (EC2, S3, Lambda), PostgreSQL, MongoDB, Redis

Education

University of Mumbai — Mumbai, Maharashtra, India
Bachelor of Data Science — *Aug 2022 – Jun 2025*

Experience

SynapseKit Framework — Remote
Open Source Contributor — *march 2026 – Present*

- Actively contributing to **SynapseKit**, a production-ready asynchronous Python framework for Large Language Model (LLM) applications and agentic graph workflows.
- Developed and integrated the **AWS Lambda execution tool** into the core framework, enabling AI agents to seamlessly trigger and interact with serverless cloud infrastructure during workflows.
- Successfully merged key features into the core repository (**PRs #1056, #1057, #1061**), including a GitLab API tool for agent interactions, a Podman sandbox backend for daemonless execution, and benchmark dataset loading capabilities.

Projects

IntelliDoc RAG | React, FastAPI, LangChain, Qdrant, Docker, WebSockets, Redis [View on GitHub]

- Built a full-stack RAG assistant (**React, FastAPI**) enabling users to upload and query complex PDFs in natural language.
- Integrated real-time **WebSocket streaming with LangChain** to deliver instant, word-by-word AI responses with zero latency.
- Designed an asynchronous document ingestion pipeline **using Celery and Redis**, optimizing retrieval performance with **Qdrant vector database** and LLM caching.

Financial Research Engine | FastAPI, LangChain, LangGraph, PostgreSQL, Celery, Redis, AWS S3 [View on GitHub]

- **Developed a multi-agent workflow using LangGraph** and Groq LLMs to orchestrate specialized AI agents (Search, Analyst, Risk, Editor), fully automating complex financial reports.
- Built a robust API layer using **FastAPI integrated with Celery and Redis** for distributed task queuing, allowing intensive AI generation to run asynchronously.
- Created a **real-time frontend dashboard** using HTML/JS and marked.js that polls the backend for job status updates, rendering markdown-formatted financial data.

Job Salary Prediction System | Random Forest, XGBoost, MLflow, Docker, Streamlit [View on GitHub]

- Built and containerized a Machine Learning pipeline predicting salaries with high accuracy based on role, location, and skills, deployed on **Render** via **Streamlit**.
- Integrated **MLflow for experiment tracking**, systematically logging model parameters and metrics across multiple runs to select the optimal model for production.
